Parts for Folders introduces the Greeting Card Device, a less expensive way to eliminate curls and wrinkles when scoring and folding greeting cards or cover stock. One of the major problems commonly known as the "alligator skin" effect, this happens when you are trying to process the sheet to score and have to go through all the sheet deflectors and rollers! This occurs on most heavy weight card stock due to the resistance of the stock to bend easily as it may be against the grain. You can use this device even if you need to deflect a sheet with an additional glued or attach piece that may create a problem traveling through the rollers and round the deflectors. The two parts may separate.

The deflectors attach to the guard that covers the top roller. See photo #1. The card stock comes straight out of the first roller and is deflected over the other rollers and straight into the "slitter / perf shaft". See photo #2. The kit consists of 4 sheet deflectors for scoring card or thicker stock when using 11" X 17". If the stock is smaller then only 2 sheet deflectors may be used. Spread them evenly across the width of the stock. This way you will be sure there is even pressure on "the bend" of the paper. There is a minimum length of the sheet that can be processed. This is measured by the sheet leaving the first roller (still gripping) and the quickest the slitter shaft can grab the sheet to keep it under perfect registration. Photo #3 and photo #4 show the path through a 30" folder.

Eliminate the alligator effect!
